UT Putnam Prep Problems, Oct 26 2016 SOME LINEAR-ALGEBRA PUTNAM PROBLEMS

- 1. Suppose $A, B \in M_4(\mathbf{R})$ commute, and $\det(A^2 + AB + B^2) = 0$. Prove that $\det(A + B) + 3\det(A B) = 6\det(A) + 6\det(B)$.
- 2. (10B1) Is there an infinite sequence of real numbers a_1, a_2, a_3, \ldots such that

$$a_1^m + a_2^m + a_3^m + \dots = m$$

for every positive integer m?

3. (95A5) Let x_1, x_2, \ldots, x_n be differentiable (real-valued) functions of a single variable f which satisfy

$$\frac{dx_1}{dt} = a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n$$

$$\frac{dx_2}{dt} = a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n$$

$$\dots$$

$$\frac{dx_n}{dt} = a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n$$

for some constants $a_{ij} > 0$. Suppose that for all $i, x_i(t) \to 0$ as $t \to \infty$. Are the functions x_1, x_2, \ldots, x_n necessarily linearly dependent?

- 4. (95A6) Suppose that each of n people writes down the numbers 1,2,3 in random order in one column of a $3 \times n$ matrix, with all orders equally likely and with the orders for different columns independent of each other. Let the row sums a, b, c of the resulting matrix be rearranged (if necessary) so that $a \le b \le c$. Show that for some $n \ge 1995$, it is at least four times as likely that both b = a + 1 and c = a + 2 as that a = b = c.
- 5. Suppose $A \in M_n(\mathbf{C})$ has rank r, where $1 \le r \le n-1$ and n > 1. Show that there exist matrices $B \in M_{n,r}(\mathbf{C})$ and $C \in M_{r,n}(\mathbf{C})$ with A = BC.
- 6. (Problem 2008-A-2). Alan and Barbara play a game in which they take turns filling entries of an initially empty 2008×2008 array. Alan plays first. At each turn, a player chooses a real number and places it in a vacant entry. The game ends when all the entries are filled. Alan wins if the determinant of the resulting matrix is nonzero; Barbara wins if its is zero. Which player has a winning strategy?
- 7. (1990-A-5). If A and B are square matrices of the same size such that ABAB = 0, does it follow that BABA = 0?
- 8. (1994-A-4). Let A and B be 2×2 matrices with integer entries such that A, A + B, A + 2B, A + 3B, and A + 4B are all invertible matrices whose inverses have integer entries. Show that A + 5B is invertible and that its inverse has integer entries.

Now flip over for some additional practice with Axiomatic Mathematics!

BONUS ROUND! A vector space may be defined as a set V on which two binary operations called + and \cdot are defined (respectively as functions $V \times V \to V$ and $\mathbf{R} \times V \to V$) subject to a set of axioms. We may express these axioms in the following way:

```
VS_1. For all u, v, w \in V we have u + (v + w) = (u + v) + w
```

 VS_2 . For all $u, v \in V$ we have u + v = v + u

VS₃. There is a vector $u \in V$ so that for all $v \in V$ we have u + v = v

 VS_4 . For all $u, v, w \in V$, if u + w = v + w then u = v; likewise if w + u = w + v then u = v.

VS₅. For all $u, v \in V$ and all $a \in \mathbf{R}$ we have $a \cdot (u + v) = a \cdot u + a \cdot v$

 VS_6 . For all $u \in V$ and all $a, b \in \mathbf{R}$ we have $(a+b) \cdot u = a \cdot u + b \cdot u$

VS₇. For all $u \in V$ and all $a, b \in \mathbf{R}$ we have $(ab) \cdot u = a \cdot (b \cdot u)$

 VS_8 . For all $u \in V$ we have $1 \cdot u = u$

For each of these axioms, give an example of an object which satisfies all the axioms EXCEPT the given one, that is, a non-vector space that satisfies the other seven axioms.

Here's an example. Take the set V to be the set of real numbers; define "vector addition" on V to be ordinary addition of real numbers; and define "scalar multiplication" by

$$c \cdot v = 0$$
 for all scalars c and vectors v

Then axioms VS_1 through VS_7 are satisfied but axiom VS_8 is not. Your job is to construct other examples (saying exactly what V, "+", and "." are) where seven of the axioms are satisfied but the remaining one is not. (I'm looking for one example where VS_1 is violated, another where VS_2 is violated, etc.)

This can be done for seven of the axioms, but one of these axioms is actually redundant—it automatically follows from the other seven axioms. Which of the eight axioms is redundant?
